La reproduction de ce rapport d'essais n'est autorisée que sous sa forme intégrale. Les résultats mentionnés dans ce rapport d'essai ne sont applicables qu'à l'échantillon soumis au laboratoire et tel qu'il est décrit dans le présent document.  
Les échantillons essayés sont à la disposition du demandeur pendant 2 mois à dater de l'envoi du rapport d'essais. Passé ce délai, ils ne pourront en aucun cas être réclamés.

Toute communication relative aux résultats des prestations d'essais de FCBA est soumise aux termes de l'article 14 des Conditions Générales de Vente.

## 1. CONTEXT

Following recent discussions about the future of authorisations under the European Regulation on Biocidal Products (the BPR) of active substances used in wood preservatives, UFME asked FCBA to carry out a survey of products registered to date for the preservation of wood intended for the manufacture of exterior joinery.

## 2. OBJECTIVES

The objectives are to establish:

1) A list of the biocidal products currently authorised under BPR in the category of PT 8 (Product Type 8 Wood preservatives) on the French market,

- For industrial use,
- Claiming a preventive efficacy against the following biological agents :
  - ✓ Decay fungi (distinguishing brown rot from white rot)
  - ✓ Blue-staining fungi
  - ✓ Subterranean termites
  - ✓ Wood-boring beetles
- For use classes 2 and 3

The products benefiting from a CTB P+ certification will be clearly identified.

When possible, a distinction will be made between products authorised for use class 3 (in general) and those restricted to use class 3.1 applications (the distinction between use class 3.1 and 3.2 is not always indicated in the Market Authorisation).

For the CTB-P+ certified products, Market Authorisations (MA) existing outside of France will be indicated when relevant.

- 2) The previous list (1) excluding the products containing propiconazole
- 3) The previous list (2) excluding the products containing IPBC and/or tebuconazole
- 4) The list of products free from propiconazole, tebuconazole and IPBC, authorised in France for the applications listed in (1).

## 3. METHODOLOGY

Information focusing on PT 8 biocidal products used for preventive treatment of wood was gathered from the websites of ECHA (European Chemical Agency) and ANSES (the agency issuing the marketing authorisation for France) and from the list of products holding the CTB P+ certification issued by FCBA.

The search for information concerns:

- Existence of a Marketing Authorisation (MA) in France and/or other European Member States and expiry date of the MA,
- Use Classs of wood for which the product is authorised,
- Biological degradation agents against which the product is authorised,
- Type of wood (softwood / hardwoods) for which use is authorised,
- Active substances contained in the product,
- Existence of a CTB P+ certification for the product.

The website of the French agency in charge of the evaluation of biocidal products ANSES ([https://www.anses.fr/fr/decisions\\_biocide](https://www.anses.fr/fr/decisions_biocide)) allows seeking information about a given product and/or MA (AMM) number. The tool does not allow to call, for example, all PT 8 products or products containing a given active substance. However, for every product authorised in France, the Market Autorisation can be opened and downloaded.

The screenshot shows the 'Registre des AMM de produits biocides' interface. On the left, there's a search form with fields for 'Nom de produit' (xilix), 'Numéro AMM' (empty), and date ranges ('De' and 'À'). Below the search form are buttons for 'Filtrer' and 'Toutes les décisions Biocides'. The main area is titled '7 résultats' and lists three entries:

- XILIX 1000 P**: Décision relative à une modification administrative d'autorisation de mise à disposition sur le marché du produit biocide XILIX 1000 P. **Changement administratif d'une autorisation nationale**. Signature : 28/10/2020 | Publication : 04/11/2020. Numéro AMM FR-2019-0052. Includes a 'Lettre décision' PDF link and a 'Voir les conclusions de l'évaluation' button.
- XILIX GEL**: Décision relative à une demande de modification majeure de l'autorisation de mise à disposition sur le marché du produit biocide XILIX GEL. **Changement majeur d'une autorisation nationale**. Signature : 20/08/2020 | Publication : 09/09/2020. Numéro AMM FR-2019-0051. Includes 'Lettre décision 2' and 'Lettre décision' PDF links and a 'Voir les conclusions de l'évaluation' button.
- XILIX 3000P**: Décision relative à une demande de modification majeure de l'autorisation de mise à disposition sur le marché du produit biocide XILIX 3000P. **Changement majeur d'une autorisation nationale**. Signature : 13/08/2020 | Publication : 26/08/2020. Numéro AMM FR-2019-0113. Includes a 'Lettre décision' PDF link and a 'Voir les conclusions de l'évaluation' button.

The ECHA website (European Chemical Agency <https://echa.europa.eu>) allows seeking information about :

- **Product identity** :
  - Product name
  - Product type (allowing the selection of only PT 8 – wood preservatives)
  - It's not possible to distinguish preventive products from curative ones
- **Active substance** present in the product, with the following limitations :
  - Only one active substance can be selected at one time,
  - It's not possible to exclude a substance (for example, to search for products which do not contain propiconazole),
  - It's not possible to search for all products containing only one active substance (for example permethrin or IPBC),

The screenshot shows the ECHA search interface. The first section is 'Product identity' with fields for 'Trade name:' (Biocidal product®) and 'Product-type:' (with a 'Select' button and 'PT08' option). The second section is 'Active substance' with fields for 'Substance name:' (e.g. Formaldehyde) and 'BAS number:' (e.g. 48). Below that is a field for 'EC / CAS number:' (e.g. 200-001-8 or 50-00-0) and a checkbox for 'Candidate for substitution'.

- **Market authorisation :**

- Autorisation holder
- Autorisation number and validity
- Market area : allows selecting a given country, i.e. France
- Autorisation status, allowing selecting only currently authorised products

**Authorisation data**

Authorisation holder:	e.g. Acme Corporation	Market area:	Select	
Authorisation number:	e.g. EU-1234567-0000	France	X	
<b>Validity of authorisation</b>				
Start date	- from - <input type="button" value="17"/>	- to - <input type="button" value="17"/>	Authorisation type:	Select
End date	- from - <input type="button" value="17"/>	- to - <input type="button" value="17"/>	Authorisation status:	Authorised

- **Product uses** : a lot of information is theoretically available but in practice the search is very complex due to the limitations of the search tool:
  - Use category:
    - inside, outside or other → it is not possible to search for a given authorised use class,
    - industrial, professional (etc) → the categories must be indicated one by one.
  - Target organism: the tool finds only the exact wording used in the corresponding MA – for example, to find out if a product protects against white rot fungi, the answer can be given by many terms such as “fungi”, “wood-decay fungi”, sometimes including errors and typos (see example below for the latine name of the fungus species *Coniophora puteana*):

**Product uses**

Use category	Field of use and user category
	Indoor X    Outdoor X    Industrial X
<b>Target organism</b>	
Scientific name	(OR)
	Coniophora Puteana X    Coniophora putanea X Coniophora puteana X    Coniophoraputeana X
Common name	(OR)
	Champignon lignivore X    Champignons X Champignons destructeur du bois (pourritures cubique et fibreuse) Champignons destructeurs du bois X Champignons destructeurs du bois (pourriture cubique et pourriture fibreuse) X
Development stage	

#### 4. RESULTS OF THE SURVEY

**At the European scale, 947 products** are currently authorised at least in one Member State in the category **TP 8** (Product-type 8: Wood preservatives).

These products are authorised either for preventive uses, curative uses or both. The target organisms against which an efficacy is claimed are different species of fungi and/or insects.

Among these products :

- **536** contain azoles (**388** propiconazole and **246** tebuconazole, frequently used in combination in the same product), which are antifungal agents (fungicides) ;
- **660** contain 3-iodo-2-propynyl butylcarbamate (IPBC) (frequently used in combination with propiconazole and/or tebuconazole), also a fungicide ;
- **84** contain boron-containing compound, acting as fungicides and insecticides (mainly boric acid, borax, and disodium octaborate tetrahydrate (DOT)) ;
- **73** quaternary ammonium compounds (dimethylbenzyl ammonium chloride (ADBAC), didecyl dimethyl ammonium carbonate (DDAC) acting as fungicides and insecticides, often combined with boron-containing compound (mainly boric acid) or IPBC.

Among these 947 products, **621** are authorised for outdoor applications (including at least use class 3) - **388** contain azoles (**348** propiconazole and **125** tebuconazole) and **518** IPBC.

**In France, 160** are currently authorised in the category PT 8, **103** of them could be used for outdoor applications (use class 3.1 at minimum). The distinction between use class 3.1 and use class 3.2 is not always made in the Marketing Authorisation (MA) - depending on the product, the MA cover applications either for use class 3.1, use class 3.1 and 3.2, or use class 3.

Among the **103** products (**84** containing azoles) :

- 4 are creosotes ;
- 2 are impregnation products meant mainly for use class 4 applications (Tanalith, containing both propiconazole and tebuconazole) ;
- 11 contain only IPBC, which is a fungicide (Aqua HS, grouping of HK Lasur products, Aidol HK Lasur)
- 17 contain only IPBC and tebuconazole, two fungicides (grouping of Aquawood TIG products) ;
- 3 contain only an insecticide substance (product having an eradicant action) ;
- 1 contain disodium tetraborate pentahydrate and K-HD0 (Xyligen 30 F, a product meant for preventive treatment of wood-based panels) ;
- **65** products contain **propiconazole**, combined with other fungicides (tebuconazole, IBPC or both) and/or an insecticide (permethrin or cypermethrin, which are the most widely used insecticide active substances in products meant for surface preventive treatment of wood for use classes 1 to 3).

Consequently, there is no product free from **azoles and/or IPBC currently authorised in France** for use class 3 applications, protecting wood both against insects and fungi.

For this reason, the survey was extended to other European countries in order to identify a greater number of products, including:

- those not currently receiving a MA in France,
- those with a fungicidal action alone (conferred by IPBC alone, boron compounds or ammonium),
- those currently authorised only for use classes 1 and 2 (and which could potentially request a MA extension to use class 3).

Among the products authorised in Europe outside of France, many contain boric acid or other boron compounds, whose future as wood preservatives could also be compromised. 84 products containing all boric acid or other borate compounds, sometimes in combination, are authorised in Europe, of which:

- 83 with boric acid: Adolit (9 products), Lignofix (11), Baufan Lignofix E-prevent, Baufan Lignofix Profi, Baufan Profi (18 products), BAQ (18 products)... ;
- 1 with boric oxide (ACS Boron Rod, authorised only in Denmark, fungicidal preventive product for use class 2) ;
- 1 with disodium octaborate tetrahydrate (Boracol 20) ;
- 14 with disodium tetraborate pentahydrate, all not being wood preventive products ;
- 18 with disodium tetraborate decahydrate.

Several of the remaining products contain quaternary ammoniums ADBAC or DDAC.

Three Tables have been drafted and are presented as follows :

(1) **Table 1: Products containing azoles (propiconazole with or without tebuconazole):** Table 1 presents the products already authorised in France or undergoing the authorisation process, for industrial and professional preventive uses, whose efficacy spectrum is compatible with use class 3 requirements (protection against fungi and wood-boring insects). Note that only 7 products claim efficacy against blue stain fungi. Products intended for use class 4 (impregnation products) and products with an insecticidal action alone are not listed. The selection includes products with CTB P+ certification (indicated in bold), some of which do not yet have a marketing authorisation in France. Several products authorised in another EU Member State are also listed for information.

(2) **Table 2: Products all containing boric acid or other boron compounds.** 5 products (or product families) have been selected on the basis of their properties, but none is currently authorised in France.

(3) **Table 3: Products without azoles or boron compounds:** 8 products (or product families) have been selected and are listed in the table, but all have limitations that are mentioned in the last column of Table 3.

- 5 products containing IPBC;
- 2 products of interest certified in France CTB P+ but currently only authorised for use class 1 and 2:
  - HYDROKOAT 16 (HYDROKOAT 6)
  - OBBIATEX HDC1
  - 1 product of interest not currently benefiting from a marketing authorisation in France, Vacsol Aqua 6118

*Note : Many authorised products are in fact very similar groups of products (differ in their pigmentation for example) but which can benefit from individual authorisations. The same product authorization may also cover several dozen of trade names (for the products concerned, not all names have been listed in this report). Similarly, some similar products may not be grouped and may be granted individual authorisations (for example, the 29 V33 products listed in Table 1 have the same efficacy spectrum and contain the same active substances).*

## 5. CONCLUSIONS

No product without azoles (propiconazole and/or tebuconazole) and/or IPBC is currently authorised in France for uses up to use class 3 and covering both the insect and fungal risks.

The search for products of interest that could potentially meet the specifications listed at the beginning of this report allowed us to identify:

- 2 products from French companies currently authorised in France for use class 1 and 2 only: HYDROKOAT 6 (Koatchimie) and OBBIATEX HDC1 (Obbia). These two products are CTB P+ certified, and HYDROKOAT has been previously certified for use class 3. These two products have the same MA number in France, resulting from a commercial agreement between the two manufacturers, but the trade name OBBIATEX HDC1 will disappear and the product will be removed from the lists at AMM on 20/04/2021.
- 1 product not currently benefiting from a MA in France, Vacsol Aqua 6118 (Lonza), authorised in several other Member States. It would be useful to ask the manufacturer whether a process to obtain a marketing authorisation in France is underway.
